ABSTRACT

KERA Online Leave Management System is an online application where employees are able to apply for their leaves online.

The system is an Intranet based application that can be accessed throughout the institution . The approval or rejection of the applied leaves is also done online. It is also possible to keep track of employees on leave. The ADMIN will be able to access employee's information efficiently at click of a button.

The main aim of coming up with OLMS is to enhance human resource capabilities in terms of managing employee leave information in an easier and fast way while improving the efficiency and productivity of the institution.

The system compiles all available leave information of each employee on a single database such as all the employees details. All these information will be available when the Admin logs in. There are features like , cancellation of leave, automatic approval of leave, report generation in this system.

OLMS is implemented using HTML, JQuery framework, CSS, PHP, and MySQL database technologies.
