ABSTRACT

The background of the study has shown that one of the factors that affects the education in the world is school dropout. This problem is mostly experienced in rural areas. The purpose of the study will be to investigate the course of primary school dropout at Kiganjo Zone in Gatundu District. The research approach will be qualitative and research design will be survey approach. The target population will be comprised of children from std 1----std 8 and primary school teachers from five public school around Kiganjo zone. The sample size will be 30.

The sampling techniques will sample random sampling techniques. The data collection tools will be interview schedules for children, parents and questionnaire for teachers. The will be analyzed guided by the objectives of the study and presented in tables and graphs. The result and recommendation of the study will be useful to the government to make policies to improve primary school education. The findings will also be used to sensitize parents on the importance of primary education.
