ABSTRACT

The web application for church administration is a feature rich, web-based administration software for managing addresses, events, reservations, Rota planning, newsletters donations and also handles events subscriptions, calendar of events display, address lists and sermon downloads.

The web application for church administration has various advantages over other modes of information delivery these advantages include:

- user friendly
- Easily Accessible.
- Easy to send and get the required information.
- They are up to date and have current information

Through observation as a method of data collection, one would discover that most church members are missing out on crucial detailed information and meetings that concerns the church.

Therefore to reduce such kinds of mistakes within the church, the use of a church website would come in handy. This website would be made from web application software's such as html, java scripts, joomla, css etc. and many others.

In conclusion therefore the web application software for church administration is a good idea to churches which have already embraced the change in technology and are willing to follow up in the events and functions of the church as they happen.
