ABSTRACT

This study looked at the impact of infantile sicknesses on development of ECD children with an objective of identifying the sicknesses their causes, effects and intervention measures taken to improve children`s health.

The study used a non-probability sampling technique in a quota sampling procedure were by 4 schools out of 8 were be sample to form a sample of 50 children out of 133 children in the population used to collect the data. The instruments to be used in the study are structured and unstructured interview schedules and screening tests, to code, tick and take notes. The data was analysed using modes, percentage, tabulating, methods and then presented on a pie charts, bar graphs and a colour chart.
