ABSTRACT

Library Management System is a system that will be used to manage school books transactions

Basically the system is designed to suit the current collage library by keeping track of library books and student.

This system is one of the integrated systems used by the administrator for performing admin level faction such as updating student records and managing library materials.

The system runs on multiple terminals, offers a graphical user interface (GUI) to it users and connects to a common database.

This system is meant to run on visual basics software and can be run on multiple computers sharing a single database for efficiency and to prevent data redundancy.
